Sample OCR Advancing Physics Questions and How to Approach Them Below are example questions reflecting the style and difficulty level of OCR advancing physics questions, along with strategies on how to approach them.

Sample Question 1: Mechanics > A car of mass 1500 kg accelerates uniformly from 0 to 20 m/s over a distance of 200 meters. Calculate the work done on the car and interpret its significance in terms of energy transfer.

Approach: Use the work-energy principle: Work done = change in kinetic energy

Calculate initial and final kinetic energies

$$\text{Work done} = \left(\frac{1}{2}\right) m v_{\text{final}}^2 - \left(\frac{1}{2}\right) m v_{\text{initial}}^2$$

Since initial velocity is zero, work done = $\left(\frac{1}{2}\right) 1500 (20)^2$

Compute and interpret as the energy transferred to the car's kinetic energy

Sample Question 2: Electricity > A parallel-plate capacitor has a capacitance of 10 μF and is connected to a 12 V battery. Calculate the energy stored in the capacitor and explain how this energy can be transferred to do work.

Approach: Use the formula: Energy = $\left(\frac{1}{2}\right) C V^2$

Convert capacitance to farads: 10 μF = $10 \times 10^{-6} \text{ F}$

Calculate energy: $\left(\frac{1}{2}\right) 10 \times 10^{-6} 12^2$

Discuss how energy stored in the electric field can be released when the capacitor discharges
