Advance cost accounting 401 problems and solutions

Advance Cost Accounting 401 Problems and Solutions
Cost accounting plays a vital role in helping organizations analyze and control their expenses, improve profitability, and make informed managerial decisions. As students and professionals delve into advanced topics like Cost Accounting 401, they often encounter complex problems that require a deep understanding of cost concepts, methodologies, and analytical techniques. This article aims to explore common Advance Cost Accounting 401 problems and solutions, providing clarity and practical approaches to tackle these challenges effectively.
Understanding the Scope of Cost Accounting 401
Before diving into specific problems, it's crucial to understand what Cost Accounting 401 entails. This advanced course covers topics such as:
Cost classification and analysis
Cost allocation and apportionment
Marginal costing and contribution analysis
Standard costing and variance analysis
Budgeting and control
Activity-based costing
Joint and by-product costing
Cost control in complex manufacturing environments
Students often face intricate problems involving these topics, especially when integrating multiple concepts into real-world scenarios.
Common Problems in Advance Cost Accounting 401
Below are some typical problems encountered by students and professionals, along with their solutions.
1. Cost Allocation and Apportionment
Problem: A manufacturing company has two departments: Production and Administration. The total overhead costs are \$120,000. The following data is available:
| Department | Direct Labour Hours | Overheads to be allocated |
|-----|-----|-----|
| Production | 10,000 | \$80,000 |
| Administration | 2,000 | \$40,000 |
Solution: Allocate the overheads to each department accurately using the appropriate basis.
Since overheads are to be allocated based on direct labour hours:
Total direct labour hours = 10,000 + 2,000 = 12,000 hours
Overhead rate per labour hour = Total overheads / Total labour hours = \$120,000 / 12,000 = \$10 per hour
Allocation: Production: 10,000 hours × \$10 = \$100,000
Administration: 2,000 hours × \$10 = \$20,000
Note: The initial data suggests overheads are already categorized, but the problem emphasizes proper allocation based on the chosen basis.
2. Standard Costing and Variance Analysis
Problem: A company sets the standard cost for 1 unit of product as follows:
Direct materials:

2 kg @ \$5/kg = \$10
Direct wages: 3 hours @ \$8/hour = \$24
During the period, the actual data are:
Materials used: 2.2 kg per unit at \$5.50/kg
Labour hours: 3.2 hours per unit at \$8.50/hour
Actual units produced: 1,000 units
Calculate the materials and labour variances.
Solution:
Materials Variances:
Material Price Variance (MPV):= (Actual Price - Standard Price) × Actual Quantity=
(\$5.50 - \$5.00) × (2.2 kg × 1,000 units)= \$0.50 × 2,200 kg = \$1,100 Unfavorable
Material Usage Variance (MUV):= (Actual Quantity - Standard Quantity) × Standard Price=
(2.2 kg - 2 kg) × \$5 × 1,000 units= 0.2 kg × \$5 × 1,000 = \$1,000 Unfavorable
Labour Variances:
Wage Rate Variance (WRV):= (Actual Rate - Standard Rate) × Actual Hours=
(\$8.50 - \$8) × (3.2 hours × 1,000 units)= \$0.50 × 3,200 hours = \$1,600 Unfavorable
Labour Efficiency Variance (LEV):= (Actual Hours - Standard Hours) × Standard Rate=
(3.2 hours - 3 hours) × \$8 × 1,000 units= 0.2 hours × \$8 × 1,000 = \$1,600 Unfavorable

3. Marginal Costing and Break-even Analysis
Problem: A firm produces a product with the following data:
Selling Price per unit: \$50
Variable Cost per unit: \$30
Fixed Costs: \$100,000
Calculate the break-even point in units and sales value.
Solution:
Contribution per unit:= Selling Price - Variable Cost = \$50 - \$30 = \$20
Break-even point (units):= Fixed Costs / Contribution per unit = \$100,000 / \$20 = 5,000 units
Break-even sales value:= Break-even units × Selling price = 5,000 × \$50 = \$250,000
This analysis helps managers understand the sales volume needed to cover all costs.

4. Activity-Based Costing (ABC) Problems
Problem: A company allocates overheads using ABC. The following data is available:

Cost Pool	Total Overheads	Cost Drivers	Total Driver Units
Machine setups	\$60,000	Number of setups	300
Quality inspections	\$40,000	Number of inspections	200

Products	Product	Number of setups	Number of inspections	Units produced
A	150	80	1,000	
B	150	120	2,000	

Calculate the overhead cost per unit for each product.
Solution:
Setup cost per setup:= \$60,000 / 300 = \$200 per setup
Inspection cost per inspection:= \$40,000 / 200 = \$200 per inspection
Total overhead allocated to each product:
Product A:
Overhead from setups: 150 setups × \$200 = \$30,000
Overhead from inspections: 80 inspections × \$200 = \$16,000
Total overhead: \$46,000
Product B:
Overhead from setups: 150 setups × \$200 = \$30,000
Overhead from inspections: 120 inspections × \$200 = \$24,000
Total overhead: \$54,000
Overhead per unit:
Product A:= \$46,000 / 1,000 units = \$46 per unit
Product B:= \$54,000 / 2,000 units = \$27 per unit
This detailed allocation helps in accurate product costing and pricing decisions.
